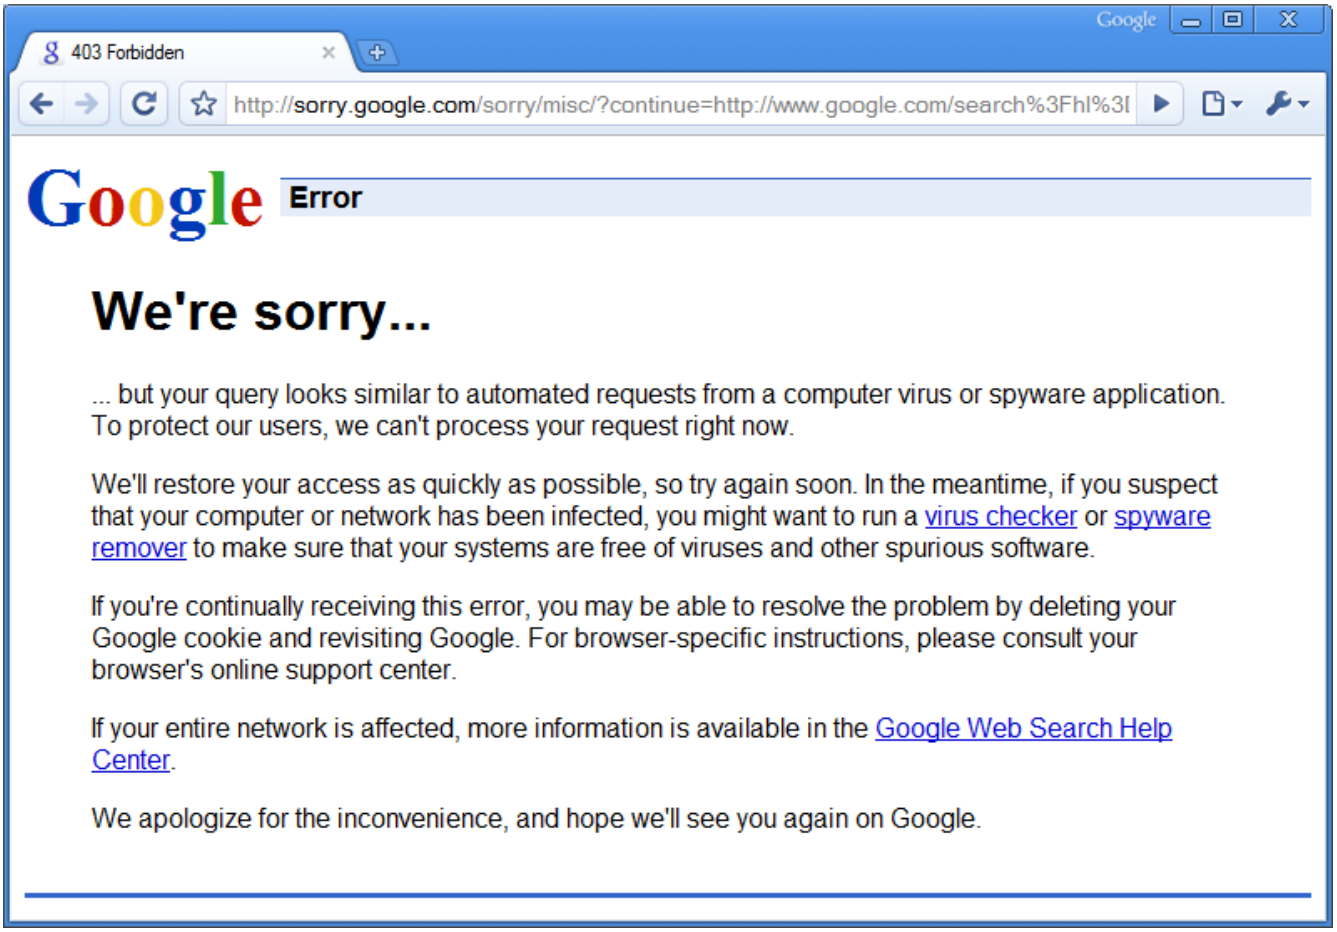
Google Hacking Code Samples

For example, one of the most common Google hacking search queries thanks to Wikipedia is the “inurl:"ViewerFrame?Mode=" “ search. By searching this string, Google will find web pages containing “ViewerFrame?Mode=” inside the url of a web page. This happens to be the string for a popular web cam software. (Page 1, Google Hacking)


One of the most promising search query I have done recently that still works great is the “"login: *" "password: *" filetype:xls” search. This pulls hundreds of thousands of excel spread sheets that contain user name / password fields in them; normally for personal records.
